WHY THE FACE SAGS

The bones in the face start to shrink as we age, causing the skin that relies upon them for support to begin to drop. "When the face looks bony, the lower lids can look baggy, causing the eyes to look older," says Dr. Eviatar. "Correcting them by adding back volume through fat transfer or lower blepharoplasty can help plump up the area," he adds. Saggy cheeks and a prominent chin can also accelerate aging. Dr. Stevens says, "The structure of the face is bone, and when it lacks prominence it descends more quickly, causing changes in the cheeks, jaw and midface that make you look older quicker."
